Patent claims

- A safety device for in particular nonrailborne 5 vehicles (9), having a monitoring device (24) which monitors a hazardous area (15) in order to detect obstacles (32) in the hazardous area (15), and brings about an output signal when an obstacle (32) detected in the hazardous area (15), characterized in 10 that the monitoring device (24) additionally monitors the road area (16), located on the opposite side of the hazardous area (15) viewed from the vehicle (9) adjoining the hazardous area (15), for obstacles (32) 15 and brings about an output signal if an obstacle (32) which prevents the hazardous area (15) being traveled through completely has been detected.
- The safety device as claimed in claim 1,
 characterized in that the monitoring device (24) has an, in particular, optical sensor device (22).
- 3. The safety device as claimed in claim 2, characterized in that the sensor device is formed by a 25 camera arrangement (41).
 - 4. The safety device as claimed in one of the preceding claims, characterized by the arrangement in the vehicle (9).
 - 5. The safety device as claimed in one of claims 1 to 3, characterized in that at least parts of the monitoring device (24) are arranged in a fixed fashion in the vicinity of the hazardous area (15).
 - 6. The safety device as claimed in claim 5 in conjunction with claim 2 or 3, characterized in that the sensor device (22, 41) is arranged in a fixed

fashion in the vicinity of the hazardous area.

- 7. The safety device as claimed in one of the preceding claims, characterized in that the monitoring device (24) has an evaluation device (23, 23') which receives and evaluates the sensor signals of the sensor device (22) in order to detect an obstacle (32) in the monitored space (15, 16).
- 10 8. The safety device as claimed in one of the preceding claims, characterized in that the output signal which is brought about by the monitoring device (24) triggers a driver warning using display means (26).

20

9. The safety device as claimed in one of the preceding claims, characterized in that the output signal which is brought about by the monitoring device (24) triggers an automatic braking process of the vehicle (9) in such a way that the vehicle (9) comes to a standstill before it enters the hazardous area (15).
